**PURPOSE:** To provide a filter essentially consisting of a cellulose and contg. a carbon sintered body formed by sintering a compact having many through- holes and capable of adsorbing and collecting unnecessary components in a liquid at a low pressure.

**CONSTITUTION:** After impregnating the compact essentially consisting of the cellulose and having many through-holes 31 with a thermosetting phenol resin, it is fired in a neutral or reducing non-oxidizing atmosphere. Preferably, the carbon sintered body 3 is to have 20-70% apparent porosity, 10-12 $\mu$ m of average pore diameter and  $\geq 50$ m<sup>2</sup>/g specific surface area.
